

INNOVV K2 Micro SD Card Guide

Maximum of 256gb micro sd card can be used.

A Class 10 Minimum 80mb/s is required. Please be sure to use a reputable branded card as often cheap/fake cards will potentially not operate with your camera and cause problems.

SD cards can be a complicated world. The camera requires the micro sd card to be formatted to **Fat32** not **Exfat**.

Formatting the sd to Fat32 is very simple for the K2 system.

Reformat via Innovv K2 App.

Place the sd card into the DVR and power on. Connect up the DVR to your mobile device via wifi. Within the settings menu select reformat the sd card. If the format is successful, the record green light will change from solid to a steady flashing light.

***Once you have successfully reformatted the SD card to Fat32
you are good to go.***
